

BridgeHub

A SaaS platform for connecting and using public data

The Burning Question

Why does answering a question with public data still requires people to search multiple websites and build separate technical integrations? Public data is available, but the journey from a question to a usable result remains fragmented. Users must judge coverage, retrieve records and preserve sources.

The Product and What Users Need

BridgeHub is a platform that lets users **connect a single MCP endpoint** to discover and extract open data from multiple supported sources through their preferred AI applications. It handles source specific APIs and data formats, returning usable data with traceable sources.

AI interpret requests + Code retrieves data = Source links and query details with results.

Potential Customers and Their Feedback

Potential user	Feedback from 10 students, 2 contributors, 1 small business
Student	Needs free, simple downloads with clear definitions and citations. Avoid mandatory MCP setup.
Open-Source contributor	Needs documented interfaces and reproducible examples. Provide stable schemas and transparent retrieval logic.
Small business	Needs dependable refreshes and relevant indicators. Initial data coverage may be insufficient. Need to validate before expanding.

Competitors and why is this idea different?

Competitors	Existing value and competitive implication
Twinkle Hub	Taiwan’s Government data MCP server. Free tier/paid plans. US coverage alone is weak differentiation.
Data Commons	No-cost public-data access with MCP, metadata and downloads. A direct substitute for core access features.

Competitors	Existing value and competitive implication
data.world / Hugging Face	Adjacent data and developer workspaces. Published individual plans provide pricing context, not evidence of demand for our product.

Our advantage is a focused teaching and lab workflow around reusable project data packs. We must demonstrate faster setup, clearer review and repeat use against free alternatives. **Verified retrieval recipes** and **reusable packs** could become an advantage over time.

Business model and willingness to pay

Subscription revenue pays for collaboration and managed retrieval. Basic access remains free. These proposed monthly USD prices are to test; no customer has demonstrated willingness to pay.

Plan	Proposed price	Reason to upgrade
Free	\$0	Discovery, previews and small downloads within usage limits.
Individual	\$9 / month	Persistent projects, saved queries and larger bounded exports.
Team	\$49 / month Up to 6 members	Shared packs, retrieval history and reproducible exports.

Hugging Face PRO lists \$9/month; data.world Individual Pro lists \$12/month. These offers support a test range, not a valuation. Institutions need separate pilot discussions. Set query/export limits after measuring provider calls, storage and computing; do not promise unlimited use.

How big could it become?

The ambition is a global SaaS, beginning with US data and education. A scale scenario is 10,000 Individual accounts $\times$ \$9 $\times$ 12 plus 1,000 separate Team accounts $\times$ \$49 $\times$ 12 = \$1.668 million annual recurring revenue. Acquisition costs, semester-related churn and support costs determine viability.
